The Weather Channel

Weather channel symbols meaning android. Android weather symbols meaning. Weather channel app symbols android. Android weather symbols two circles. What do the weather symbols on my phone mean. Weather symbols on android phone. Weather app.symbols. Android weather app symbols.

Tablets are the perfect tools for keeping up with news—but to get the best possible experience, you need to have the best available applications. And with all of the Android tablet apps that exist, finding the highest-quality creations can take an awful lot of searching. Not to worry, though: We've done the hard work for you. These 10 apps are the cream of the crop when it comes to viewing news and weather content on Android tablets. And all of them are free to use. So what are you waiting for? Read on, and get ready to stay informed in style. When it comes to straightforward RSS reading on a tablet, Google's free Google Reader app is tough to beat. The app is fast, clean, and fully tablet-optimized: You can browse through feeds and stories on the left side of the screen while simultaneously scrolling through content on the right; and you can scroll through stories on your home screen by using the included interactive widget. As you'd expect with an official Google product, the Google Reader app offers instant, seamless integration with your Web-based Google Reader, so there's no need for setup or manual synchronization. The excellent (and free) Pulse News application offers an interesting alternative take on RSS reading for Android tablets. Pulse News provides a visual, icon-driven interface for keeping up with your favorite websites. After setting up rows of news and information sources, you simply scroll left or right to browse through the latest stories from any site, or scroll up or down to look through different sites' content. You can read stories within the app itself via a right-side column that appears as needed. Pulse lets you choose from an array of popular sites to get your reading started; it can also pull feeds directly from your Google Reader subscriptions. Google's Google Currents app aims to bring magazine-quality visuals into the digital domain. Currents formats Web-based stories to make them visually pleasing on tablets of any size, with large images and clear, well-spaced text. Google has worked with numerous publications to make full stories available through the Currents app; you can subscribe to any of those publications or import your own feeds from your Google Reader account. Currents also has a "trending" section where you can view recent stories, images, and videos in a slew of different categories. The app supports offline reading, too, and it automatically syncs your content across all of your mobile devices. Currents is free. If you want to keep up with news but don't want to follow any specific sites, News360 for Tablets may be just the thing for you. News360 resembles Google News, except that it's optimized for tablets: It keeps tabs on the latest hot topics in various categories, and it brings you clusters of stories from numerous sources. You can view general "top stories" or browse by category. When you find a story you like, you can read it within the app, where it will be surrounded by scrollable images and information from other sources. News360 can even connect to your social media accounts to learn what kinds of stories interest you and to customize its news offerings to your tastes. The app is free. AccuWeather's AccuWeather for Honeycomb is a gorgeous Android tablet app that's built to take advantage of your device's large screen. Available for free in the Android Market, the app provides all of the weather info you need in an easy-to-navigate interface with eye-grabbing graphics. You can get the latest word on your area's conditions, scroll through hourly forecasts for the next 24 hours, or flip through weather predictions for the next 15 days, tapping on any day for detailed information. AccuWeather has a slew of other features, too, including live radar and satellite images, forecast videos, and weather news. The app also includes a home-screen widget that supports flip-style viewing of forecasts for multiple cities. For a comparatively minimalist but equally pleasing approach to tablet-based weather, try the free WeatherBug for Honeycomb app. It presents you with panels showing current conditions and long-term forecasts for any number of cities; tapping a panel causes it to flip over to reveal detailed information about the area's temperature, wind, humidity, and precipitation levels. WeatherBug uses simple, two-dimensional graphics that some people will prefer to AccuWeather's more photo-intensive look. The app features a home-screen widget that offers support for flip-style viewing of multiple cities. One of the original tablet-optimized apps for Android, the CNN App for Android Tablet continues to set the bar for big-screen news programming. CNN's free tablet app fills your tablet's display with thumbnails of current stories and video reports from the service's international news network. You can view stories chronologically or by category, and you can view user-submitted "iReports" and even file your own photo or video to be featured. When you view a story, you'll see related images, videos, and comments alongside the text. CNN's tablet app includes an excellent widget with flipbook-like icons of news stories from any category you choose. Another Android tablet original, USA Today for Tablet is a must-have for any news junkie who appreciates the USA Today approach to journalism. This free app incorporates a refreshingly light and crisp design that makes great use of the tablet's screen space, with categories and scrollable story lists on the left and full-length stories on the right. It has a Gmail-esque scrollable home-screen widget, too. The CNBC Real-Time for Android app makes tablet-based stock management a snap. Available free in the Android Market, the app has everything you could desire for tracking your finances, including real-time stock quotes, a live CNBC stock ticker, and all of the latest financial news. You can search for information on specific stocks, too, and set up your own custom ticker to keep tabs on companies in your portfolio. CNBC's Android tablet app also includes breaking news alerts and video clips from CNBC's television network. Combine all of those features with an attractive, easy-to-use graphical interface, and you have an app that looks and works like a million bucks. Some magazines have their own tablet-optimized apps for subscribers. For all of the others, there's Zinio. This free Android app gives you tablet-optimized access to numerous print magazines, ranging from Billboard to PCWorld (of course). You can browse through tons of free articles or buy complete issues of any title. (In addition to the always-free articles, Zinio provides a limited number of free full-issue downloads to start.) It's like having your own personal periodical rack in the palm of your hand—and you don't even have to worry about paper cuts. Google doesn't list its Weather app on the Play Store, but you can still add it to your home screen by using the official Google app on your Android phone. Here's how to do it. Add Google's Weather App to Your Android Phone Google's Weather app is hidden inside the Google app on your Android phone. With a few taps in the Google app, you can place it on one of your home screens. To start, launch the Google app on your Android phone. If you don't have this app, download and install it first. Next, launch the Google app. On the app's main screen, tap the search box at the top. In the search box, type "weather" and select it from the search results. You'll see the current weather information. In the top-right corner of this weather card, tap the three-dot menu. In the menu that opens after you tap the three dots, select "Add to Home Screen." A pop-up with the title "Add to Home Screen" will open. Tap and drag the little sun icon in the pop-up to your home screen where you want the Weather app. Alternatively, tap "Add Automatically" to automatically add the Weather app to the last home screen on your Android phone. Access the home screen (by swiping left or right on the screen) where you added the app. You'll see the Weather app on that screen. Tap the app to open it and view your current weather information. To remove the app from your home screen, tap and hold the app icon and select "Remove" from the menu. The Weather app has been removed from your screen, but it still exists within the Google app on your phone. You can add it back at any time. If you love knowing the current weather, check out some other weather apps that you can use on your Android phone. RELATED: The Best Weather Apps for Android In today's world, we've gotten used to seeing the weather change with little notice — and sometime no notice at all. From flash floods and hurricanes to knowing precisely how ungodly hot it is outside, having a trustworthy weather app on your side can make all the difference. There are a lot of options to choose from if you're looking for the best weather apps for Android, and we've rounded up some of our favorites here. It's easy to understand why Accuweather is one of the best Android apps after you download it. All of your pertinent information is laid out in an easy-to-view interface, while MinuteCast offers some of the most reliable notifications for when the rain is about to start, or stop. Today Weather is a beautiful application that makes it easy to get a quick overview of what to expect for the day. You can also peruse the app and find all of the more detailed information you would want. Not everyone wants to have to open an app to get information, and with 1Weather's widgets, you won't have to. The app offers a plethora of beautifully-designed widgets to choose from, so you can see what to expect at a glance. 1. Accuweather If you're trying to find the best weather apps for Android, it's difficult to ignore Accuweather with its simplistic design and great information. The app offers a clean layout, providing all of the information about what to expect from the day. After downloading Accuweather, the app features a breakdown of the weather that is expected to take place, along with an overview of the next day. At the bottom, you have shortcuts for a Today View, along with Hourly, Daily, and a view of the radar for your area. But instead of just viewing the radar for the next few hours, Accuweather actually offers several different mapping layers to choose from. These include a satellite view, any watches or warnings in your area, and even a five-day outlook for precipitation. The app is free to download, but you'll have to deal with some ads placed throughout. If you want to get rid of the ads, you can do so via an in-app purchase from within the sidebar. Accuweather has even gone so far to include a persistent notification that shows the current temperature in your status bar, along with the current weather conditions. Plus, it has a Wear OS app that will work great with some of the best Android smartwatches. 2. Today Weather Source: Andrew Myrick / Android Central (Image credit: Source: Andrew Myrick / Android Central) There's a reason why Today Weather is a fan favorite for those who don't want a bunch of extraneous information at their fingertips. The app itself offers a pretty basic layout, but the real power of Today Weather comes with the multitude of widgets. There are actually a total of 19 different widgets to choose from, all ranging in different sizes to better fit your Home Screen design. From within the app, you can view some basic information at the top, including the temperatures and any expected precipitation. But as you scroll further down, you'll see more in-depth details about the day. These include the "real feel" temperature, humidity levels, UV index, and even the dew point. There are a number of user-selectable sources including AccuWeather, Dark Sky, and Yr.no, a Norwegian forecasting service that can produce more accurate forecasts for many parts of the world that aren't America. Moving even further down reveals the hourly and daily forecasts, so you can quickly and easily plan out when you'll want to grab the umbrella or snow boots. 3. 1Weather At first glance, there's not much 1Weather has to offer that isn't already made available by the other apps on this list. However, after opening 1Weather for the first time, you can definitely see the appeal. After sharing your location data with the app to get precise updates, you'll be asked if you want to see "weather facts" appear whenever you open the app. This is something unique and that we haven't found elsewhere. As for the interface itself, all of the information you need appears right at the top, along with some ads placed throughout. There are different tabs to swipe between, depending on whether you want to see the forecast for the week or figure out when the sunset is. Scrolling down from the main screen and you'll find "1Weather Shorts", which are short videos about major weather events, along with 1Weather TV. This is a local forecast show that you can listen to if you prefer the news broadcast style to figure out what the weather will be like. There are a few flaws we've found in our extended use of 1Weather, such as the app not always updating immediately when re-opened, but the app performs well and looks good doing it. Some other great weather apps for Android There are more weather apps on the Play Store than you can shake a stick at. That means that while some of our favorites may be great for most, having options to choose from is even better. So here are some of the other great weather apps for Android. Yahoo Weather Source: Andrew Myrick / Android Central (Image credit: Source: Andrew Myrick / Android Central) Instead of relying on a bunch of extra features to show your weather information, Yahoo Weather does things a bit differently. The app uses various images from Flickr to provide a backdrop for what weather conditions are for the day. Scrolling down provides the forecast and other minor details, while the big (+) button in the top right corner makes it easy to add other cities to scroll between. In fact, when you start up Yahoo Weather for the first time, the app asks if you want to add any other "destination" locations. These are just big cities so that you can daydream about the warm weather in San Francisco while a snow storm bears down on the East Coast. Yahoo even makes it possible to set up daily notifications so you'll know what to expect before you even look outside. Radarscope Source: Andrew Myrick / Android Central (Image credit: Source: Andrew Myrick / Android Central) Some folks just want to get an overview of what to expect from the weather for the day, but others want to dive a bit deeper — and by "a bit," we mean a lot. Radarscope is one of the best radar apps on the Play Store with the ability to view the radar overview for a myriad of locations. You can choose either specific radars from different areas in the world, or just enter your own location and see the radar view from there. Being able to view the radar makes it so that you can see how large or small that storm really is. Plus, it's easy to get a better idea of how serious the storm is, which is why Radarscope is a favorite among meteorologists and storm chasers alike. Unlike the other weather apps on this list, you won't find a daily forecast, or anything of the sort. You just get some good ol' radars to scroll through. This app also has secondary subscriptions for the really high-def radar scans and other features. Overdrop Source: Andrew Myrick / Android Central (Image credit: Source: Andrew Myrick / Android Central) Some weather apps don't provide any options when it comes to selecting a weather source. For many, that'll be fine, but finding an app that lets you switch between sources is pretty awesome, and that's what you'll get with Overdrop. From the main page, Overdrop shows you the current weather details, with more information capable of being expanded with a drop-down arrow. The app itself features a fun design with multiple themes to choose from during the initial setup. Plus, you can opt to use a persistent notification in your status bar, showing you what the current weather conditions are. There's a weather forecast section that shows you the temperature, wind speeds, and precipitation levels over the next 24 hours. Overdrop even includes more than 50 different widgets to choose from if you want to see the weather on your Home Screen. But to unlock the customization options of these widgets and the persistent notification, you'll need to sign up for OverDrop Pro. This also unlocks a few of the other themes, so you can truly personalize your weather app in every way imaginable. Flux Source: Andrew Myrick / Android Central (Image credit: Source: Andrew Myrick / Android Central) Flux is a newcomer to the stiff competition for best weather apps for Android. The app is still technically in beta, but you can download and use it just as you would any other application. Flux features a beautiful and simple interface to view your weather forecast, along with several different themes to choose from. The app even will allow you to choose different themes to be shown for when your phone is in Light Mode or Dark Mode. In the bottom toolbar, Flux is equipped with a daily overview panel, which acts as the main interface. There are also panels available to view the radar for your location, along with a summary panel for seeing what the rest of the week expects to bring. There are a few different widgets to choose from if you want to add the weather to your Home Screen. And Flux even makes it possible to customize and change around the order of the "cards" when viewing the main overview panel. Flux is really a great app, and we hope that the developer continues to bring new themes and features for everyone to take advantage of. Appy Weather One of the greatest reasons for using Dark Sky was its combination of features paired with an elegant design. Now that Dark Sky is gone from the Play Store, it seems that Appy Weather is attempting to take the mantle while continuing to rely on Dark Sky (and other services) for its forecasts. The app even won Google's "Best of 2019" for Everyday Essential thanks to its gorgeous design. The app is also easy to use with a unique Timeline view. There are three options on the main page to view, allowing you to switch between Hourly, Daily, and the aforementioned Timeline views. However, if you want to unlock the full potential of Appy Weather, you'll need to sign up for its Plus, Pro, or <Pro subscriptions. The Plus subscription includes widgets, notifications, the ability to view the temperature in your status bar, and removes ads. Meanwhile, the Pro subscription offers some premium weather providers, along with custom notifications. Finally, <Pro unlocks all of the different possible map layers, including Storms, Fires, Lightning, Air Quality, and more. While Appy Weather is great enough to be used without adding another subscription to your list, you'll definitely want to subscribe to unlock the full power and versatility. MyRadar Weather Radar It's one thing to have a weather app let you know when it's going to rain, but it's another thing entirely to be able to track the storm system as it rolls through. With MyRadar, you can determine just how quickly a storm system is moving through. With this information, you can subscribe whether you should cancel your plans, or just wait out until the storm passes through. In addition to providing accurate radar for weather in your area, these are some of the most professional-looking radars that you'll find in any app. MyRadar even lets you customize them with different map types and layers to display different pieces of information. What also helps MyRadar stand out from the crowd is there is also aviation data from SIGMETs and AIRMETs so even pilots will know what the conditions are looking like.
